

Leica RM2265 - Config.

The following section describes four RM2265 configurations, i.e. a fully equipped 'ready-to-use' system for typical applications in the field of clinical histopathology, biomedical research and industry. Each of these complete outfits can be ordered by one single order number.

There are various benefits to ordering configurations as compared to ordering individual line items for you, our customer as well as for us manufacturer.

For the customer, there are substantial savings when purchasing configurations. Since configurations are much easier to handle on the logistics and production planning side, we can offer package prices which are up to 15 % lower than the summarized prices of the same individual line items.

In addition, the customer can be sure that the configuration is complete and ready for use for his/her application. We at Leica Microsystems Nussloch manufacture/assemble the instruments according to configuration specs and test them as complete outfits in our QA department thus ensuring that all key accessories of the instrument are working flawlessly with each other. Configurations allow us to keep inventory ready for shipment as soon as an order comes in, as there is no assorting/packing of individual line items involved.

If you think further configurations that would be useful for a wide range of customers could be added to our program, please do not hesitate to call us and let us know. - Thank you for your valuable contribution to make a good system work even better
