## Operating Manual

**Your Bambi Air Compressor is a precision engineered product.  
By following these simple steps you will ensure years of trouble free use.**

Parts & Service are available from your Bambi dealer.

It is important to quote Model, Type & Serial Number in all communications.

The substitution of parts not manufactured nor approved by Bambi can impair performance, service life and create potential mechanical or personnel hazards and will invalidate your warranty.

Bambi reserves the right to modify the contents of this operating booklet without notice and the information is in no way binding on the company.

## **Warranty**

Provided the operating instructions have been followed, and the compressor has been properly maintained, Bambi VT and VTS compressors are guaranteed against faulty workmanship for a period of 2 years.

The air receiver is guaranteed for 5 years.

The guarantee does not cover damage by misuse, incorrect parts or service.  
Contact Bambi Air Compressors or your retailer for further information.

## 1) Safety Precautions

What you **must** do:

- Read these instructions before using your air compressor.
- Ensure the compressor has been installed, electrically connected and piped in by a properly qualified person.
- Ensure the compressor is kept upright at all times.

What you **must not** do:

- Do not attempt any maintenance on the compressor until it has been isolated from the power supply.
- Do not attempt any work on the compressor until the air receiver and pipe work systems are depressurised.
- Compressed air is dangerous if misused and can prove fatal. Avoid any bodily contact with compressed air.
- During operation the motor will become quite hot to the touch. Avoid contact to prevent burns.
- Never tamper with the pressure relief valve.
- Never lubricate the oil free motor or pump assembly; this will cause severe damage.
- Never obstruct cooling fans or outlet vents.

## 2) Siting The Compressor

What you **must** do:

- Provide adequate protection from the weather.
- Site the compressor level in both planes.
- Larger models are heavy. Ensure the surface has sufficient load bearing capacity.
- Allow access for maintenance all around the compressor.
- Site in a dry area, avoiding damp or humid conditions. The site must be dust free, well ventilated and have a cool ambient temperature. 40°C should be regarded as the maximum allowable ambient.

What you **must not** do:

- Enclose the compressor or allow hot air generated by the motor to re-circulate around the compressor. Ensure there is 30cm clearance around the compressor
- Restrict air flow around the after cooler, after cooler fan unit or end cover ventilation [S models].

### **Important ! For Silenced VTS Models:**

These compressors generate heat.

Never restrict any of the ventilation grilles otherwise serious damage may occur.

## **Electrical Connections**

Where applicable, compressors are supplied with a moulded plug in accordance with national standards.

Never remove the moulded plug.

### **Note !**

Duplex models VT300/300D, VT400/400D must be connected to a dedicated fused 20 amp supply.

Wired in accordance with European Standard –

Single phase: Blue = neutral, Brown = live, Yellow & Green Stripe = earth

Three phase: Brown/Black/Grey = Phase conductors

Blue = Neutral

Yellow and Green Stripe = earth

Three phase compressors should be connected by a competent person

**All three phase units require neutral supply**

### **3) Unpacking Instructions for: VTS75 / VTS150 / VTS200/ VTS250**

#### **3.1) Fitting Mounting Castors**

Before using the compressor you must remove the external packaging and fit the castors supplied as they also provide essential clearance for the lower cooling fan exhaust.

**Note !**

Failure to do so will cause damage and invalidate your warranty

Remove the four bolts securing the compressor to its wooden packing, carefully lift the compressor to enable you to screw in the four castors using the same mounting holes.

Take care lifting the compressor, some models are heavy.

#### **3.2) Removing Internal Transit Packing**

Before using the compressor you must remove the internal packing, failure to do so will cause damage to the compressor. The procedure is as follows -

##### **VTS75/150/200**

Fig 1.

Using the hex key provided, remove the 3 bolts fixing the left hand end cover in place (when viewed from the front) - see fig 1.

There are three packing pieces, two either side of the pump unit, one on top of the cooling fan assembly.

Ensure that these are removed.

##### **VTS250D**

Using the hex key provided, remove the 4 bolts fixing the top cover in place and remove the top cover - see fig 1a.

There is one packing piece on the top of the pump unit.

Fig 1a.

Ensure that this is removed.

Reassembly is a reverse of the above but do not over-tighten the cover fixing bolts.

#### **3.3) Fitting Condensate Bottle – VTS Dryer models only**

Fig.2 - VTS Condensate bottle position

Compressors fitted with an air dryer are supplied with a condensate bottle which you will need to fit before use.

Attach the condensate bottle mounting bracket to the front panel of the compressor using the 2 plastic clips provided. These are a simple push fit.

Slide the condensate bottle into the mounting bracket.

Push the black plastic condensate tube which emerges from the front panel into the hole in the lid of the bottle. As on Fig. 2

Fit the exhaust silencer to the condensate tube by pushing firmly on to the end of the tube.

Fit the bottle lid ensuring that it “clicks” home.

## 4) Operation

Refer to exploded parts diagrams and illustrations when reading this section.

### Note ! For VTS Models

Ensure the transit packing has been removed as described in the previous section.  
Failure to do so will cause damage and invalidate your warranty

### 4.1) Starting & Stopping

Plug the compressor into an outlet socket of nominal voltage and fitted with the correct fuse as shown in section Electrical Connections.

Switch the compressor on (I) using the on/off switch located on the front panel or pressure switch - see fig 3 pictures:

Fig. 3 On off switch versions

The compressor will start running and automatically switch off at the preset pressure.

#### Note!

Duplex Models VT300/300D, VT400/400D are fitted with a sequential start system to reduce electrical loading. You will notice one motor starting a few seconds after the other [single phase only]. This is normal.

As air is used the pressure drops and the motor will restart at the preset pressure. Approx 2 Bar differential.

#### Note !

Each time the compressor switches off or the power supply is interrupted, you will hear a short hiss of air. You are hearing the unloader valve discharging the residual delivery pipe pressure. This is normal.

### 4.2) Adjusting Outlet Pressure

Use the pressure regulator to adjust the outlet pressure.

To increase line pressure, rotate the black knob next to the pressure gauge in a clockwise manner, to decrease turn anti clockwise. It is possible to lock the setting by pushing the knob down until it "clicks" home – see fig 4.

#### Fig 4: Gauge layouts

On cabinet [VTS] models, gauges are labelled.

On others:

The smaller gauge is SELECTED pressure  
The larger is RECEIVER pressure

## **5) Routine Maintenance**

Refer to preventative maintenance section for frequency.

### **5.1) Draining the Air Receiver**

Drain condensate from air receiver at a pressure of no more than 2 Bar.

Slowly open the red coloured drain tap provided to allow water to flow out – see fig 5.

Fig. 5 Drain tap types

Close drain tap when all water has drained off. Draining is not required on dryer equipped models.

Automatic drains where fitted do not require draining, however the condensate bottle will require emptying – see following section “Operation Dryer Models”.

**Note !**

Waste condensate must be handled in accordance with national environmental rules.

### **5.2) Check Pressure Relief Valve**

Ensure the air receiver is not pressurised. On “S” models, refer to section 8: Removing Housing Cover

Unscrew the knurled end of the pressure relief valve until an audible “click” is heard. Retighten without using excessive force.

Fig. 6 Pressure relief valve positions

## **6) Operation – Dryer Models**

When equipped with an air dryer unit, the compressor will automatically dry the compressed air before it is stored in the air receiver. This happens automatically and requires no additional maintenance. This eliminates the need to manually drain the air receiver.

Operation is similar to standard versions with the following change :-

Each time the compressor switches off or the power supply is interrupted, the dryer purge valve opens and automatically activates the drain valve on the after cooler filter allowing the dryer tower to regenerate. All accumulated moisture will discharge into the condensate bottle.

This should be emptied when it reaches  $\frac{3}{4}$  full.

Fig. 7 Condensate bottle locations

Do not exceed the recommended 50% duty cycle, otherwise the dryer will not activate and the humidity of the air will increase. Ensure the after cooler fins are kept clear of accumulated dust.

**Note!**

It is normal for the VTS 250D units to constantly bleed air from the condensate bottle.

## 7) Technical

We recommend the compressor has a maximum 50% duty cycle to prolong pump life.

### Note !

The motor must never be allowed to run continuously otherwise it will overheat and may become damaged.

Do not ignore air leaks. All air connections must be leak free to prevent the compressor from over heating.

The compressor is fitted with 2 thermal overloads. In the event of excessive temperature the compressor will switch off and the external thermal protector will activate. To re-set follow the procedure below-

### **Models: VT75/75D, VT150/150D, VT200/200D, VT250/250D**

Switch off at the pressure switch [see Fig. 2]. Allow 50 minutes for the motor to cool down then switch back on at the pressure switch. The compressor will now restart.

### **Models: VTS75/75D, VTS150/150D, VTS200/200D, VTS250/250D**

Do not switch the compressor off after overheating as this will prevent the internal cooling fans which reduce the temperature inside the housing from running.

Allow 50 minutes for the motor to cool down.

Press the thermal re-set button, you will hear an audible click – see fig 8.

The compressor will now restart.

Fig. 8 Thermal re-set button

### **Models: VT300/300D, VT400/400D**

The re-set is integral with the pressure switch.

The pressure switch will automatically turn off (0) in the event of motor overload.

Turn the pressure switch to the on position [see Fig. 3].

The compressor will now restart.

If the compressor still does not run, switch off immediately and disconnect from the mains supply.

You **must** find the cause of the overload and rectify this before continuing to use the compressor.

Check for -

- Drain tap not closed properly
- Air leaks on the pneumatic fittings
- Compressor not the correct size for the work load
- Cooling fan outlets restricted

**Contact your service engineer to investigate the cause.**

## **8) Removing Housing Cover (VTS Models Only)**

For routine maintenance it may be necessary to remove the top cover. Adhere to the following procedure:

### **Models: VTS 75/75D, 150/150D, 200/200D**

Disconnect from the mains power supply and release all the air from the compressor and the air system.

Using the hex key provided, remove the 3 bolts fixing each end cover in place and remove the end covers.

Remove the bolts holding the top cover in place.  
Gently lift up the top housing.

**Note !**

Do not use excessive force as this will strain the electrical and air connections.

Carefully pull apart the electrical multi connector by squeezing the side clips and gently pulling the connector apart. Do not use excessive force.

To release the air connections, push the connector collar in and simultaneously pull the air tube out.

Reassembly is a reverse of the above but check that -

- The air tubes are pushed fully home into the connector and seal
- The electrical connector is secure
- No wires or air tubes are trapped in the housing join

### **Models: VTS250/250D**

Disconnect from the mains power supply and release all the air from the compressor and the air system

Using the hex key provided, remove the 4 bolts fixing the top cover in place and remove the top cover.

## Technical Specification

### **VT 0.75Hp Pump Specification**

Motor Kw / Hp	0.55 / 0.75
Voltage	220/240
Frequency Hz	50
Amps	3.9
Displacement l/min	120

### **VT 1.5Hp Pump Specification**

Motor Kw / Hp	1.1 / 1.5
Voltage [Single phase - 3 phase]	220/240 - 380/415
Frequency Hz	50
Amps [Single phase - 3 phase]	6.8 - 2.9
Displacement l/min	175

### **VT 2.0Hp Pump Specification**

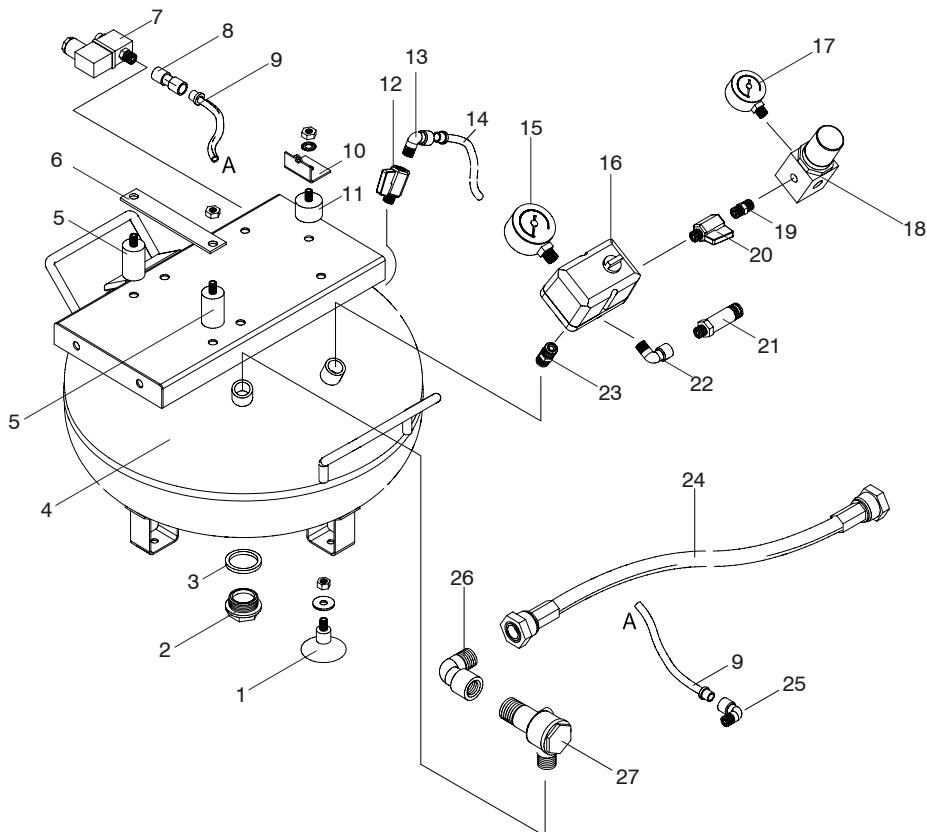

Motor Kw / Hp	1.5 / 2.0
Voltage [Single phase - 3 phase]	220/240 - 380/415
Frequency Hz	50
Amps [Single phase - 3 phase]	9.9 - 3.6
Displacement l/min	220

### **VT 2.5Hp Pump Specification**

Motor Kw / Hp	1.84 / 2.5
Voltage [Single phase - 3 phase]	220/240 - 380/415
Frequency Hz	50
Amps [Single phase - 3 phase]	12.9 - 4.6
Displacement l/min	300

VTS75D 150D 200D

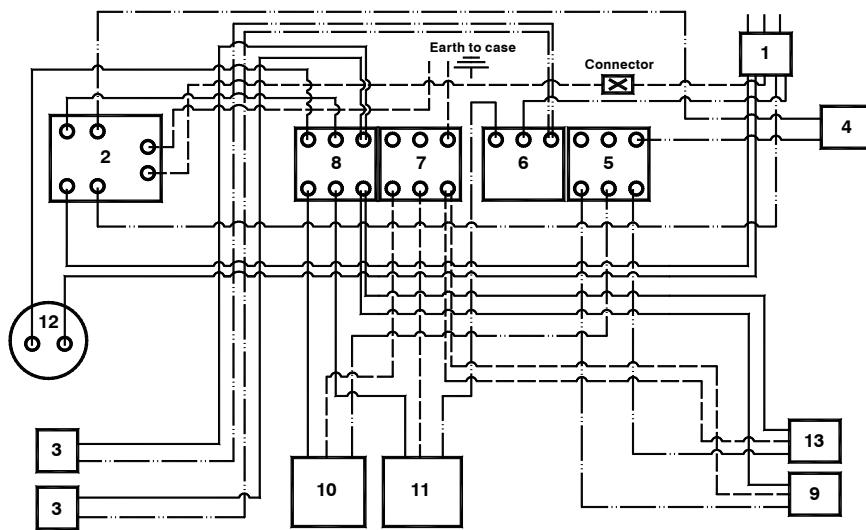

- 1 - Thermal fan switch
- 2 - Pressure switch
- 3 - Exhaust fan

#### **4 - Thermal trip 5,6,7 & 8 Connection blocks 9 - Solenoid**

- 10 - Compressor
- 11 - Cooling fan
- 12 - Power in

## Wiring Diagrams - SINGLE PHASE - VTS cont'd

### VTS250 / 250D

1 - Power in

2 - Pressure switch

3 - Cooling fans

4 - Thermal trip

5,6,7 &amp; 8 Connection blocks

9 - Solenoid

10 - Motor

11 - Aftercooler fan

12 - Thermal fan switch

13 - Timer box

Note! Timer box only used  
on Dryer models**NOTE!**

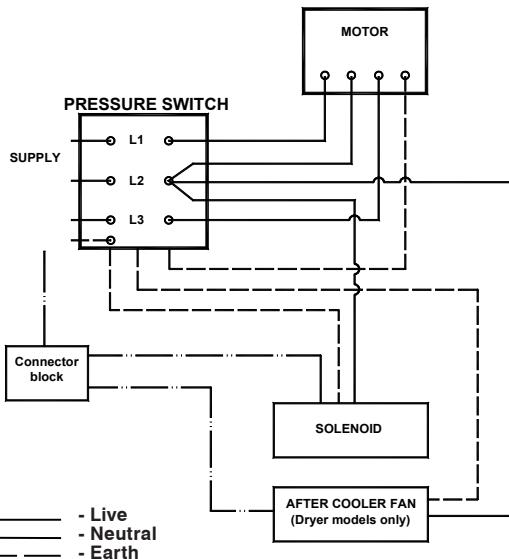

The cooling fans  
remain live even with  
the power switch in  
the "OFF" position

**KEY:**

—	- Live
— . —	- Neutral
— — —	- Earth
